

4:1 Beverage on Ground Antenna Matching Transformer Model – SV-BOG

Connections for Matching Transformer

This Transformer will match the 200 ohm Beverage Antenna impedance to the 50 ohm impedance of your Coax resulting in the proper transfer of signals to your receiver.

A typical BOG will be between 160ft and 200ft in length and terminated with approximately 240 ohms resistor which is included with this transformer.

Note: This is a “Receive only device and not intended to be Transmitted into. Transmitting into this device will eventually cause it to fail.
